

KRUGER

eBNC Ecowatt EC Plenum Fan Series

Energy (W) Efficient

Powerful

Low Noise

Why KRUGER?

KRUGER has been a leading innovator and manufacturer of residential, commercial and industrial fan application solutions across Asia since 1985. Today with a direct presence in over 18 regions throughout Asia, world class R&D and manufacturing facilities, KRUGER are able to offer their customers unparalleled service and support at a local level. Our customers placed their trust in KRUGER.

What is KRUGER eBNC Ecowatt EC Plenum Fan?

The eBNC Ecowatt plenum fan series is a newly developed, compact and highly efficient EC fan solution for air handling units.

Aluminium Impeller

3rd generation aerodynamically optimized plenum fan impeller made of aluminium material for its light weight and excellent matched up with an EC motor integrated with an electronically controlled internal driver motor (ECM) that was carefully selected and rigorously tested that provides an optimized system efficiency.

+

=

Efficient EC PM Motor

Integrated with a 3-phase controller vector EC motor that is significantly more efficient than conventional fan with AC motors. The permanent magnet increases the electrical efficiency of the motor while eliminates rotor copper and rotor slip losses and the electronic commutation eliminates mechanical wear of the carbon brushes. The end outcome is a far efficient motor.

Compact & Versatile

With the flow optimized "Boomerang" motor support aerodynamic design and integrated fan and drive assembly, it is a key advantage over conventional fans as it saves 40-50% in fan section length compared to equivalent plenum fan with AC motor. It is lightweight and lesser components makes it a versatile installation for AHU.

Reduce overall length by 40 ~ 50%

Speed Control

There are 3 simple wiring methods to control motor speed as shown below:

- Manual speed control 0-10V via Potentiometer.
- Automatic control signal 0-10Vdc or 4-20mA from Demand Controlled Ventilation (DCV) or Building Management System (BMS).
- Automatic control by Modbus RTU program that is connected via RS485 interface.

Full control wiring schematic is available in wiring section.

REB-ECOWATT

Pressure/Airflow Control

Why Use a KRUGER eBNC Ecowatt EC Plenum Fan?

- ➔ The efficient vector motor allows energy saving over the full and part load operating spectrum while keeping system efficiency at optimum level.
- ➔ Reliable and optimized fan system where the entire fan, EC motor and control system is installed and tested as a complete system.
- ➔ Boomerang brackets allow for optimized aerodynamic airflow across the fan outlet.
- ➔ Low sound level due to good EC motor efficiency plus a light aluminium impeller ensures a low power consumption that leads to reduction in sound levels.
- ➔ Simple, easy to handle, light and compact.

Applications

Data Centre

Ideally suited for both new AHU equipment, retrofit applications and VAV systems. Highly efficient, versatile, clean and compact, it is recommended for applications and installation in data centres, clean rooms and other commercial buildings and general industrial applications where a low energy input is required.

The eBNC Ecowatt EC plenum fan is available in a ready-to-install design with aerodynamic "boomerang" spider bracket and a square mounting plate for mounting to AHU support panel or a fan wall.

It is designed for air handling application where the fan wheel operates without a housing but inside a plenum. The fan wheel pressurizes the entire plenum in which the fan is installed. This allows for air ducts to be directly connected from any direction within the plenum. Spider mounting brackets are used for mounting to the AHU.

Fan Wall Installation

The eBNC Ecowatt EC plenum fan system is also suited for fan wall technology design approach whereby multiple small fans are mounted together in a fan wall. It can be used as a replacement for single large AC fan or even multiples of AC fans. It derives extensive benefits such as footprint savings, lower energy cost over the full and part load spectrum, lower noise, increased reliability and redundancy and lower maintenance cost.

Summary of Key Specifications

A

Nominal fan diameter ranges from 315mm to 630mm with data at optimum efficiency point below.

Data at Optimum Efficiency Point							
eBNC Ecowatt Model	Airflow (cms)	Ps (Pa)	Motor Inlet Power	SFP w/m³/s	Amp (A)	Speed (RPM)	LwO dB(A)
315 LP S5	0.71	768	0.91	1426	1.45	2595	86
315 HP S2	1.06	1764	3.18	2997	4.69	3920	94
355 LP S5	1.03	994	1.73	1669	2.48	2610	86

Impeller Design & Specification

Fan Information		
No.	Component	Material
1	Inlet Cone	Galvanized Steel
2	Inlet Cone Frame	Galvanized Steel
3	Wheel	Aluminium
4	Motor	EC Type Motor
5	Motor Support	Galvanized Steel
6	Spider Bracket	Galvanized Steel
7	Hub	Aluminium
8	Bracket	Galvanized Steel
9	Number of Blades	7
10	Fan Weight (casing+ wheel+motor)	eBNC 315 = 23.2 kg eBNC 355 = 25.8 kg eBNC 400 = 28.2 kg eBNC 450 = 58.0 kg eBNC 500 = 63.0 kg eBNC 560 = 63.7 kg eBNC 630 = 71.5 kg

To optimize it for EC motor operations, the wheel of the eBNC Ecowatt is specially made from lightweight aluminium material and with its 7 backwards curved continuously welded and profile blade, it delivers strong static pressure with good efficiency and economical operation.

D

Certification

Kruger Ventilation Industries Asia Co., Ltd. certifies that the eBNC Ecowatt series shown herein is licensed to bear the AMCA seal. The ratings shown are based on tests and procedures performed in accordance with AMCA Publication 211 and AMCA Publication 311 and comply with the requirements of the AMCA Certified Ratings Program.

E

High Balancing Quality

Motor impeller is statically and dynamically balanced to ISO 14694:2003 and AMCA 204 - G2.5 Standard. G1.0 Standard is available upon request.

Flow Measurement (Option)

Fan volume flow rate could be estimated through the measurement of differential pressure at the fan inlet. The differential pressure compares the static pressure at the fan inlet cone (narrowest ID) and the static pressure of suction chamber/duct (right before the fan inlet). This measurement is based on the Bernoulli Principle and Continuity Equation, where volume flow rate through a converging cone could be calculated by the static pressure drop across the cone. There are 4 pressure taps installed on the fan inlet cone and these pressure taps are connected to the differential pressure transmitter by pressure tubes as Figure 1.

The volume flow rate of BNC fan can be calculated using the following formula:

$$Q = \frac{Kx \sqrt{\frac{\rho_1}{\rho_2} x \Delta P}}{3600}$$

Where :

Q = Volume flow rate (CMS)

K = K-factor

ΔP = Measured static pressure difference (Pa) between the fan inlet and the suction chamber

ρ_1 = Standard air density 1.2 kg/m³

ρ_2 = Actual air density (kg/m³)

Ecowatt eBNC Fan Performance Curves

The graph below shows an overview of the maximum air performance for all the models measured in a chamber test rig. The motor power input ranges from 0.5 kW to 3.3 kW. High performance high-pressure motor is available for models eBNC 315/355.

Effect of Installation Space

Installation in a square box may cause a reduction in air performance.

d_h = Hydraulic diameter
Formula: $d_h = 2 \times W \times H / (W + H)$
 W = Width of the box
 H = Height of the box
 D = Outside diameter of the fan

For square cross sections that are greater than 1.9x the impeller diameter, no deduction has to be applied to the catalogue curves. Refer to curve below for appropriate correction factor when d_h/D is lower than 1.9. Below is an example of square cross sections and respective impeller diameter. Where 1.9D is equal or smaller than cross sectional area of $W \times H$ divided by $(W + H)$, no correction factor is required. Apply the appropriate correction factor as defined in the graph if d_h/D is smaller than 1.9.

D	w(m)	H(m)	dh/D	dh=2(WxH)/(W+H)	1.9*D ≤ dh
315	1	1	3.17	1.00	0.60
355	1	1	2.82	1.00	0.67
400	1	1	2.50	1.00	0.76
450	1	1	2.22	1.00	0.86
500	1	1	2.00	1.00	0.95
560	1	1	1.79	1.00	1.06
630	1	1	1.59	1.00	1.20

Note: The Correction Factor for Airflow due to Effect of Installation Space are not licensed by AMCA.

Characteristic Curve

Fan curves at the maximum speed and 3 different partial speeds with FEI curves are available with corresponding curves for power input and fan system static efficiency.

Tender Specifications Data Sheet

Technical Data	Result	Unit
Fan Type/Model		
Airflow		cms
Static Pressure		Pa
Stat Overall Efficiency, Ps %		%
Operating Speed, n		rpm
Motor Type	EC Motor	
Type of Control	10-100% Speed Control	
Motor Efficiency Class	IE4	
Total Power Input (kW)		kW
Specific Fan Power (w/cms)		w/cms
Nominal Voltage Range (V)	380-480	V
Line Frequency	50/60	Hz
Nominal Current		A
Degree of Protection (IP)		
Sound Power Level, Lin (Lw0/Lwi)		dB
Sound Power Level, Lw0 (A)		dB (A)
Sound Pressure Level (Lp0 (A)@1.5m)		dB (A)
Permissible Amb Temperature		°C
Weight of Fan		kg

Power and Control Wiring

The following section shows the terminal layouts and wiring method for eBNC Ecowatt plug fans. eBNC fan has various speed control functions are available as follows:

1. Manual speed control by using of Potentiometer: Analog signal 0–10Vdc.
2. Automatic speed control by using of Demand Controlled Ventilation (DCV) or Building Management System (BMS): Analog signal 0–10Vdc or 4–20mA.
3. Automatic speed control by using of eBNC Modbus RTU interface PC program: RS485 digital port.

Please contact Kruger to get a training about eBNC Modbus RTU interface PC program and configurations method.

Power Wiring

- ➔ Use the appropriate cable size for each motor model by referring to power wiring section.
- ➔ Shielded cables are not required for use on power cables.
- ➔ Where multiple fans are installed in one AHU, individual circuit breakers must be installed for each fan.
- ➔ Three-phase main power must be connected, do not use the output from a variable speed drive to power an eBNC Ecowatt plenum fan.

Control Wiring

- ➔ Ensure that the RSA, RSB, 0-10V input, +10V output and ground of each fan are accessible at an external location away from the three phase power supply connections.
- ➔ Where MODBUS over RS485 is used, appropriate shielded cables should be used.

Ecowatt eBNC 315, 355 & 400

Three-phase fan eBNC 315, 355 & 400 wiring Diagram consists of 2 parts: power and control wiring terminals are shown in Fig. 1.

Fig. 1. eBNC 315, 355 & 400 Wiring Diagram

Color	Wiring	Function	Description
Brown	Control	485A	RS485 data +, 485 communication interface
Black	Control	485B	RS485 data -, 485 communication interface
Green	Control	24V	24Vdc output
White	Control	FG	Speed output 2 pulses per revolution
Red	Control	10V	10Vdc, 10mA max
Yellow	Control	VSP/PWM	Analog Input 0-10V or 4-20mA
Blue	Control	GND	Signal ground
Brown	Power	L1(R)	Power input phase1
Blue	Power	L2(S)	Power input phase2
Black	Power	L3(T)	Power input phase3
Yellow/Green	Power	PE	Protective Earth
Orange	Relay	NO	Output relay N.O. contact
Gray	Relay	COM	Output relay common contact
Red	Relay	NC	Output relay N.C. contact

Noted: There are 2 spec of wire harness length (1.2m for Single fan and 3.5m for Multi fan)

Power Wiring

- ➔ Power wiring (L1, L2 and L3) connections to the 3PH 380V 50/60Hz power supply (R, S, T).
- ➔ PE wire is the protective earth terminal like below diagram.
- ➔ Use AWG16 or bigger for L1, L2, L3 and PE.

Status Relay

- ➔ Status relay should be connected to show the status of Fan motor operation.
- ➔ When normal operation the **NC**-COM will be short circuit.
- ➔ When fan faults as below conditions, **NO**-COM will be short circuit.
 - Motor Overheat
 - Electronics Overheat
 - Locked Rotor
 - Hall Sensor Error

Control Wiring

There are 3 wiring simple connection methods for control motor speed as shown below.

1. Manual speed control by using of Potentiometer: Analog signal 0–10Vdc.
2. Automatic speed control by using of Demand Controlled Ventilation (DCV) or Building Management System (BMS): Analog signal 0–10Vdc or 4–20mA.
3. Automatic speed control by using of eBNC Modbus RTU interface PC program: RS485 digital port.

Please contact Kruger to get a training about eBNC Modbus RTU interface PC program and configurations method.

a.1 Manual speed control by using of Potentiometer (Analog signal 0-10Vdc)

b.1 Automatic speed control by using of DCV or BMS (Analog signal 0-10Vdc and 4-20mA)

c.1 Automatic speed control by using of Modbus RTU interface PC program (RS485 digital port)

a.2 Example of Manual speed control by use Potentiometer (analog signal 0–10Vdc) for Multiple fan connection

b.2 Example of Automatic speed control by use Demand Controlled Ventilation (DCV) or Building Management System (BMS) via analog signal 0–10Vdc or 4–20mA for Multiple fan connection

PE L3 L2 L1
(T) (S) (R)

c.2 Example of Automatic speed control by use eBNC Modbus RTU interface PC program via RS485 digital port for Multiple fan connection

Ecowatt eBNC 450, 500, 560 & 630

Three-phase fan eBNC 450, 500, 560 & 630 wiring Diagram consists of 2 parts: power and control wiring terminals are shown in Figure.2 below.

Fig. 2. eBNC 450, 500, 560 & 630 Wiring Diagram

Terminal	Wiring	Connection	Function
TL1	Power	L1(U)	Power input phase 1
	Power	L2(V)	Power input phase 2
	Power	L3(W)	Power input phase 3
	Power	PE	Protective Earth
TL2	Relay	COM	Output Relay common contact
	Relay	NO	Output relay N.O. contact
	Relay	NC	Output relay N.C. contact
TL3	Control	GND	Signal ground
	Control	10V	10Vdc, 10mA max
	Control	GND	Signal ground
	Control	A1	Analog Input 1, 0-10 V
	Control	A2	Analog Input 2, 4-20 mA
	Control	Aout	Analog Output, Programmable output
	Control	GND	Signal ground
	Control	D1	Digital Input 1, Motor start enable signal, 0V: Start Disable, 10V/24V: Start Enable
	Control	D2	Digital Input 2, Motor rotation direction control signal, 0V: CW, 10/24V: CCW
TL4	Supply	GND	Supply ground
	Supply	24V	+24 VDC supply, 50mA max
TL5	Control	485A	RS 485 data+, 485 communication interface
	Control	485B	RS 485 data-, 485 communication interface
	Control	485G	RS 485 ground, 485 communication interface

Power Wiring

- ➔ Power wiring (L1, L2 and L3) connections to the 3PH 380V 50/60Hz power supply (R, S, T).
- ➔ PE wire is the protective earth terminal like below diagram.
- ➔ Use AWG14 or bigger for L1, L2, L3 and PE

Status Relay

- ➔ Status relay should be connected to show the status of Fan motor operation.
- ➔ When normal operation the **NC**–COM will be short circuit.
- ➔ When fan faults as below conditions, **NO**–COM will be short circuit.
 - Motor Overheat
 - Electronics Overheat
 - Locked Rotor
 - Hall Sensor Error

Start Signal

- ➔ Start signal D1 terminal must be always connected to 24V terminal as Factory default.

Rotating Direction Signal

- ➔ Rotating direction signal D2 terminal must be always connected to 24V terminal as Factory default.

Control Wiring

There are 3 wiring simple connection methods for control motor speed as shown below.

- 1.Manual speed control by using of Potentiometer: Analog signal 0–10Vdc.
- 2.Automatic speed control by using of Demand Controlled Ventilation (DCV) or Building Management System (BMS): Analog signal 0–10Vdc or 4–20mA
- 3.Automatic speed control by using of eBNC Modbus RTU interface PC program: RS485 digital port.

Please contact Kruger to get a training about eBNC Modbus RTU interface PC program and configurations method.

a.1 Manual speed control by using of Potentiometer (Analog signal 0-10Vdc)

b.1 Automatic speed control by using of DCV or BMS (Analog signal 0-10Vdc and 4-20mA)

c.1 Automatic speed control by using of Modbus RTU interface PC program (RS485 digital port)

a.2 Example of Manual speed control by use of Potentiometer (analog signal 0–10Vdc) for Multiple fan connection

b.2 Example of Automatic speed control by use Demand Controlled Ventilation (DCV) or Building Management System (BMS) via analog signal 0–10Vdc or 4–20mA for Multiple fan connection

c.2 Example of Automatic speed control by use eBNC Modbus RTU interface PC program via RS485 digital port for Multiple fan connection

Recommendations for RS485 connection

- To prevent interference from electromagnetic fields, please always use shielded twisted pair cable.
- To keep the stability of the control signal, please add a 120 Ohm, 0.5W resistor at the end of the control line.

THAILAND (Regional Head Quarter)**KRUGER VENTILATION INDUSTRIES ASIA CO. LTD.**
